

# C++ Comments

## C++ Comments

---

Comments in a C++ program are not compiled and ignored during execution. Comments are used to increase the readability of the program.

There are two types of comments in C++ based on number of lines the comment is. They are:

- Single Line Comments
- Multiple Line Comments

In this tutorial, we shall learn how to write single line comments and multiple line comments.

## Single Line C++ Comments

---

To write single line comments in C++ program, use double forward slash `//`. Anything after `//` in that line is considered a comment.

## Example

---

In the following example, we shall write a C++ program, with single line comments.

### C++ Program

```
#include <iostream>
using namespace std;

int main() {
    //this is a comment
    cout << "Hello World!"; //another comment
}
```

In the above program, **line-5** is a comment. It started with `//` and then there is some text. Whole line is a comment.

In **line-6**, we have a statement to print to standard output. After the statement, in the same line, we have written a comment `//another comment`.

These are single line comments in C++.

## Multiple Line C++ Comments

You can also write comments that span over two or more lines.

To write multiple line comments, start your comment with `/*` and end with `*/`.

## Example

Following is an example program, where we have a multiple line comment enclosed between `/*` and `*/`.

### C++ Program

```
#include <iostream>
using namespace std;

int main() {
    /*
    This is a
    multiple line
    comment
    */
    cout << "Hello World!";
}
```

These are multiple line comments.

## Conclusion

In this [C++ Tutorial](#), we learned how to write single line and multiple line comments in C++ programs.
