

Docker Tutorial – Learn Docker concepts with examples

Docker Tutorial

Welcome to Docker Tutorial. Docker Tutorial provides concepts from basics like installation, docker file, etc. to advanced concepts with detailed examples.

Prerequisites

Basic exposure to Operating Systems like Windows, Linux, Mac OS X would be sufficient. Having a programming experience would be of great help.

What is a Docker ?

Docker is a platform for software containers. A docker contains all the components inside the container itself,

required for running the application, thus assuring the running of application in any machine. Hence when an application is developed and moved through different servers or computers in a docker, no care has to be taken to maintain exact same environment through all the systems.
