

Scala – Read String from Console as Input

If you are developing a console application with Scala, you may need to read input from the user.

In this tutorial, we will learn how to read a line from the console as input from a user.

To read a line from console input, we use the method `scala.io.StdIn.readLine()`.

Example to Read String from Console as Input

In this example, we shall read a string from console and print it to the console.

```
object  
ReadInputExample {
```

```
  object ReadInputExample {  
    def main(args: Array[String]) {  
      val name = scala.io.StdIn.readLine("Enter your name: ")  
      println("Hello "+name)  
    }  
  }  
}
```

Output

```
Enter your name: Arjun  
Hello Arjun
```

```
Enter your name: Arjun  
Hello Arjun
```
